Project Title: Book MyTrain

Problem Statement:

Railway passengers frequently need to know about their ticket reservation status, ticket availability on a particular train or for a place, train arrival or departure details, special trains etc. Customer information centres at the railway stations are unable to serve such queries at peak periods due to limited number of reservation counters available to the passengers and customers. On most of the reservation systems there are long queues, so it takes a long time for any individual to book the ticket. As of now there are no call center facilities available to solve the queries of the passengers.

Solution:

So, we thought of developing a web-based application "**Book MyTrain**" which would provide the users all these facilities from his respective terminal only.

This online railway ticket reservation system aims to develop a web application which provides trains details, trains availability, as well as the facility to book tickets online for customers. Our website contains information regarding booking of railway tickets. Users will be able to search the train availability, the exact fare, the arrival and departure time of the train and they can also book the ticket by using their preferred payment option, after booking the ticket if the user want to cancel it then they can easily do so.
